Changing the Agenda a Bit
   We need to focus our project more
   Our data model is very large and our purpose needs to be more specific

Advice on which database system would be better
SQL Usually a better choice for smaller projects because it is easier
   MongoDB scales better - Horizontal sharding
   Grant: Likes building schemas
   Sequelize is an ORM that works with SQL databases

MVP Questions
   Sabrina: What do we need?
   Evan: Something that solves the problem, not necessarily nice to use
      Something like logging in may not even be necessary
      Build around the purpose, build extendedly

Generating Pages
   Sabrina: Should we generate 100% or a mix?
   Evan: That is rare. Usually do some pages and some ajax

Working Questions
   Sabrina: Do we each need to implement a feature fully (front and back end)?
   Evan: Not really, you just need to divide it up in the contract and each work on all phases

Design
   We are trying to solve too many problems. What single problem should we solve?
   Do we do management? Searching for Employers or Employees? Posting Jobs?
   Is it more important for companies to find people? Or people to find companies?
   We should talk to companies.
   Evan: If we like the management aspect, hook up to another API for people to drop their email into.
      EG. give a Gmail and it goes through and figures out where you are in the process.
